

Unleash Your Assets - Let Us Help You Tokenize

Infinity Digital Assets is building a revolutionary platform to democratize investment in Real-World Assets using blockchain technology. The key problem this solves is making high-value investments like real estate and precious metals accessible to everyday investors.

Traditionally, these assets required large upfront capital and excluded smaller investors. Infinity's solution tokenizes real-world assets into digital fractional shares, enabling anyone to invest starting from just \$50.

The project roadmap spans 12 months. In Month 1, the team will complete development of the web app and begin their digital marketing campaign focused on educating potential users about tokenization of real-world assets.

In Month 2, the mobile app will launch allowing users to access the platform anywhere. The team will also list their first real estate asset for tokenization and fractional investment.

Month 3 involves expanded marketing to drive user acquisition and engagement. Months 4-6 continue heavy marketing alongside optimization of the platform's features and user experience.

In Month 7, integration with the XRPL begins by building XRP payment capabilities. Months 8-9 focus on full integration, allowing assets to be tokenized directly on the XRPL.

Month 10 finalizes the XRPL integration with testing, while Months 11-12 enable trading of tokenized assets on the XRPL DEX.

Grant funds will be allocated across three key areas: Labor, Marketing, and Hosting/Security.

Labor covers the engineering team building the platform, mobile apps, and integrating with XRPL. Marketing involves digital campaigns, social media, and promotions to acquire users. Hosting/Security funds top-tier infrastructure to ensure platform reliability and user asset protections.

To execute the milestones, Infinity leverages proven technologies including React Native for mobile apps, Node.js and AWS to build a scalable cloud-native platform. Security is enhanced through leading providers like Chainalysis & Fireblock.

For XRPL integration, the sdks and tools like xrpl.js will be used to connect the platform's transaction processing, token issuance, and trading capabilities with the XRP Ledger's performance, reliability and liquidity.

In summary, Infinity Digital Assets brings financial Inclusion of real-world asset investing to the world by tokenizing assets on blockchain. The grant will accelerate development and XRPL integration to provide users an end-to-end solution for fractionalized investment in assets like real estate and precious metals.
